

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

- 1-6. (Canceled)
7. (Previously Presented) The video screen assembly of claim 10, wherein the video screen is rotatable about a basically horizontal axis of rotation in relation to the pivoting arm.
8. (Previously Presented) The video screen assembly of claim 7, wherein the video screen is rotatable through an angle of 150 degrees to 210 degrees, in particular approximately 180 degrees, in relation to the pivoting arm.
9. (Previously Presented) The video screen assembly of claim 10, wherein the pivoting arm, at its end facing the video screen, comprises a frame, inside which the video screen is rotatably arranged.

10. (Currently Amended) A video screen assembly for mounting to a vehicle seat, the video screen assembly comprising:

a fitting for pivotally mounting the video screen to the vehicle seat, the video screen being adjustable from a first, lower, position of use to a second, upper, position of use;

a pivoting arm connected to the fitting for rotation about a generally horizontal axis of rotation, the pivoting arm having a frame that encloses the video screen, the video screen being rotatably supported on the pivoting arm rotatable relative to the frame;

a spring having a spring force opposed to the gravitational force when moving the video screen between the first and second positions; and

a first articulated joint between the fitting and the pivoting arm and a second articulated joint between the pivoting arm frame and the video screen, wherein the first and second articulated joints each comprise a releasable non-positive arresting device,

wherein the video screen is rotatable, in relation to the fitting, through an angle of 150 degrees to 210 degrees from the first position of use to the second position of use, and

wherein the video screen can be pivoted upwards through an angle of 10 degrees to 20 degrees from a stowed position into the first, lower, position of use.

11. (Previously Presented) The video screen assembly of claim 10, wherein the first and second articulated joint interact with one another through the use of a torque transmitting device, in such a way that when folding the pivoting arm in relation to the fitting, the video screen is turned through a basically equal angle in relation to the pivoting arm.

12. (Previously Presented) The video screen assembly of claim 11, wherein the torque-transmitting device comprises a belt drive.

13. (Previously Presented) A vehicle seat having a head restraint and a back rest having a rear side having an upper edge, the vehicle seat comprising the video screen assembly of claim 10.

14. (Previously Presented) The vehicle seat of claim 13, wherein the video screen assembly is arranged in the rear side of the backrest in the first, lower position of use and behind the hear restraint in the second, upper position of use.

15. (Previously Presented) The vehicle seat of claim 14, wherein the video screen is pivotable to the stowed position through an angle of 150 degrees to 210 degrees, in relation to the pivoting arm and can be shifted to a protected position in which the video screen display side is turned towards the rear side of the back rest.

16. (Previously Presented) A video screen assembly configured to be mounted to a vehicle seat for use by an occupant positioned behind the vehicle seat, the video screen assembly comprising:

- a first joint defining a first axis of rotation, the first axis of rotation configured to be a substantially horizontal axis extending transverse to the vehicle seat;

- an arm coupled to the first joint and rotatable about the first axis of rotation between a first use position and a second use position;

- a frame coupled to the arm;

- a second joint provided at the frame, the second joint defining a second axis of rotation, the second axis of rotation being substantially parallel to the first axis of rotation; and

- a video screen supported at the frame and mounted to the second joint, the video screen having a front side and a rear side, a display being provided on the front side;

- wherein the video screen is rotatable relative to the frame about the second axis of rotation between approximately 150 degrees and approximately 210 degrees so that the display can face the occupant when the arm is in both the first use position and the second use position.

17. (Previously Presented) The video screen assembly of claim 16, wherein the first use position is a lower position and the second use position is an upper position, the first use position being between approximately 150 degrees and approximately 210 degrees offset from the second use position.

18. (Previously Presented) The video screen of assembly of claim 17, wherein the first use position is approximately 180 degrees offset from the second use position.

19. (Previously Presented) The video screen assembly of claim 16, wherein the first joint comprises a releasable locking device configured to retain the frame in an angular position about the first axis that has been selected by the occupant.

20. (Previously Presented) The video screen assembly of claim 16, wherein the second joint comprises a releasable locking device configured to retain the screen in an angular position about the second axis that has been selected by the occupant.

21. (Previously Presented) The video screen assembly of claim 16, wherein the video screen is rotatable approximately 180 degrees about the second axis when the frame is in a position that is between the first use position and the second use position.

22. (Currently Amended) The video screen assembly of claim 16, wherein the screen rotates about the second axis of rotation ~~without assistance by the occupant~~ automatically when the frame rotates between the first use position and the second use position.

23. (Previously Presented) The video screen assembly of claim 22, further comprising a belt drive configured to synchronize the rotation of the frame about the first axis of rotation and the rotation of the screen about the second axis of rotation.

24. (Previously Presented) A vehicle seat having a head restraint and a backrest having a rear side having an upper edge, the vehicle seat comprising the video screen assembly of claim 16.

25. (Previously Presented) The vehicle seat of claim 24, wherein the video screen assembly is configured to be substantially behind the backrest in the first use position and substantially behind the head restraint in the second use position.

26. (Previously Presented) The vehicle seat of claim 25, wherein the frame is further rotatable about the first axis of rotation to a stowed position that is past the first position, the display of the screen is configured to face the backrest when the frame is in the stowed position.
